

HF RADAR: A KEYSTONE FOR VALIDATING HIGH-RESOLUTION OCEAN MODELS

E. Reyes, B. Mourre, J. Hernández,
E. Aguiar, M. Juza, A. Orfila and J. Tintoré

OUTLINE

1. Goal
2. Study area
3. Data set description
 - HFR & met-ocean buoy
 - Model: WMOP operational
4. Results HFR vs. In-situ data
5. Results WMOP vs. HFR data
6. Conclusions

01 GOAL**HFR vs. in-situ data**

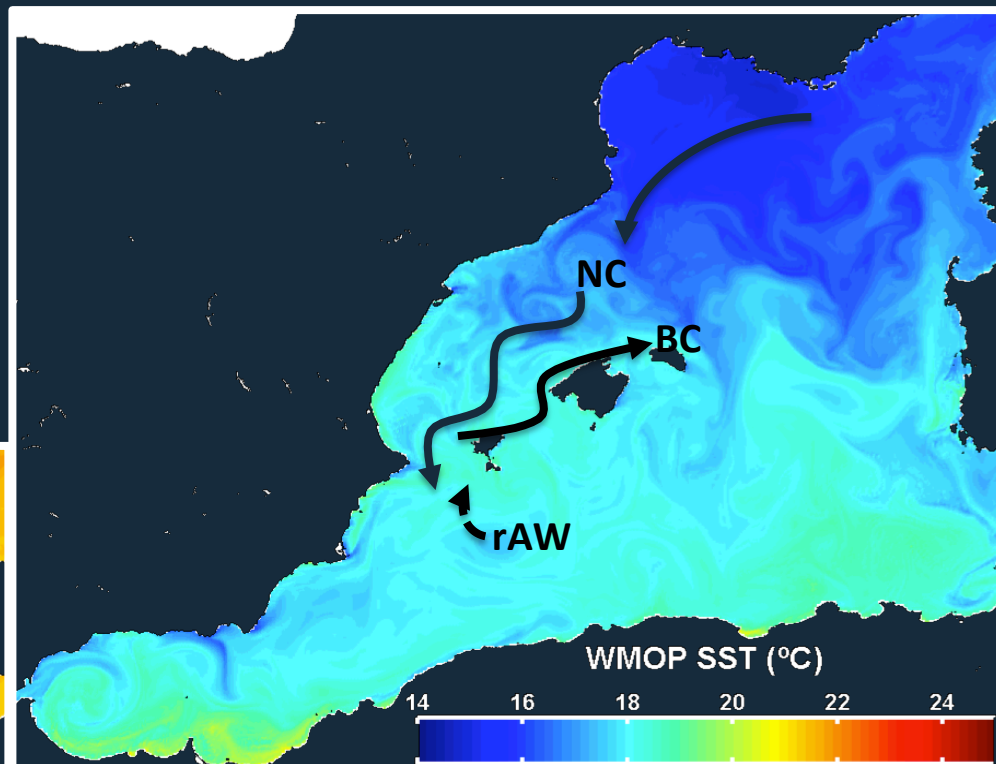

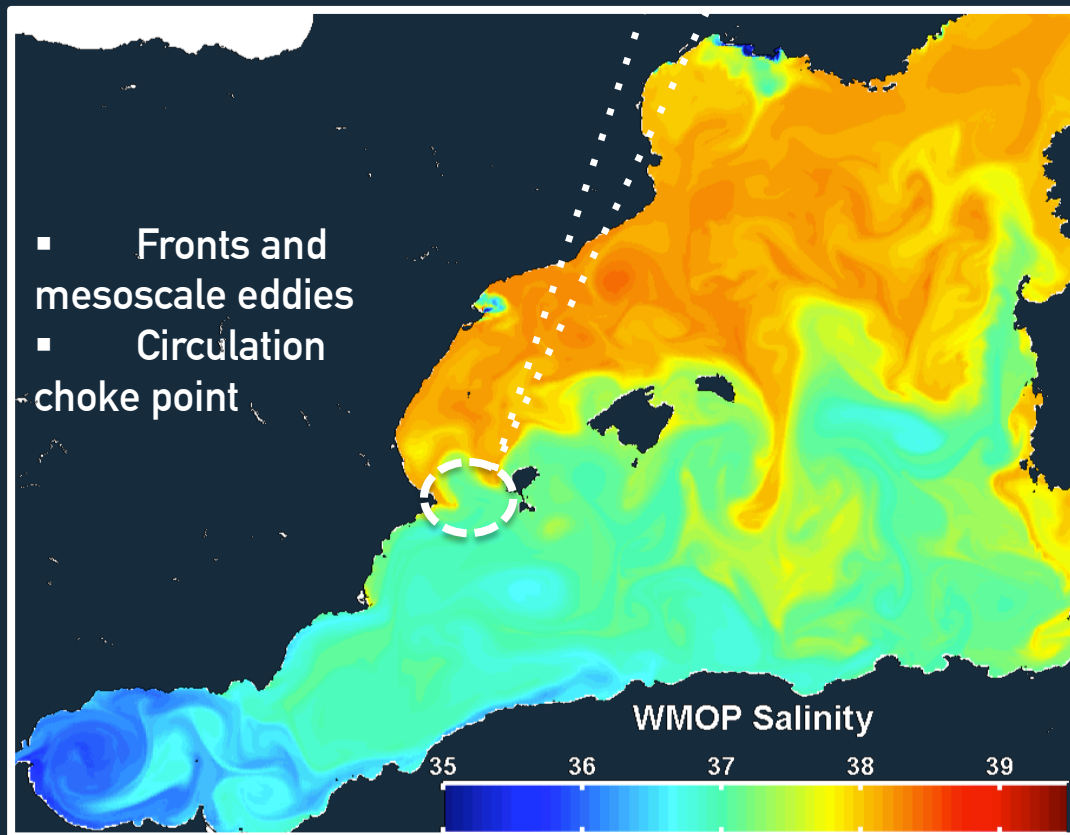

- To validate the HF radar surface currents using in-situ current observations
- To quantify the quality of the HFR surface current measurements
- To evaluate the HFR performance
- To identify temporal periods of malfunctioning of the radar (or the buoy)

WMOP forecast model assessment vs. HFR

- To ensure that model simulation represents the dynamic of the ocean surface (prerequisite to DA)
- To characterize and understand the model errors
- To compare different versions and evaluate potential improvements

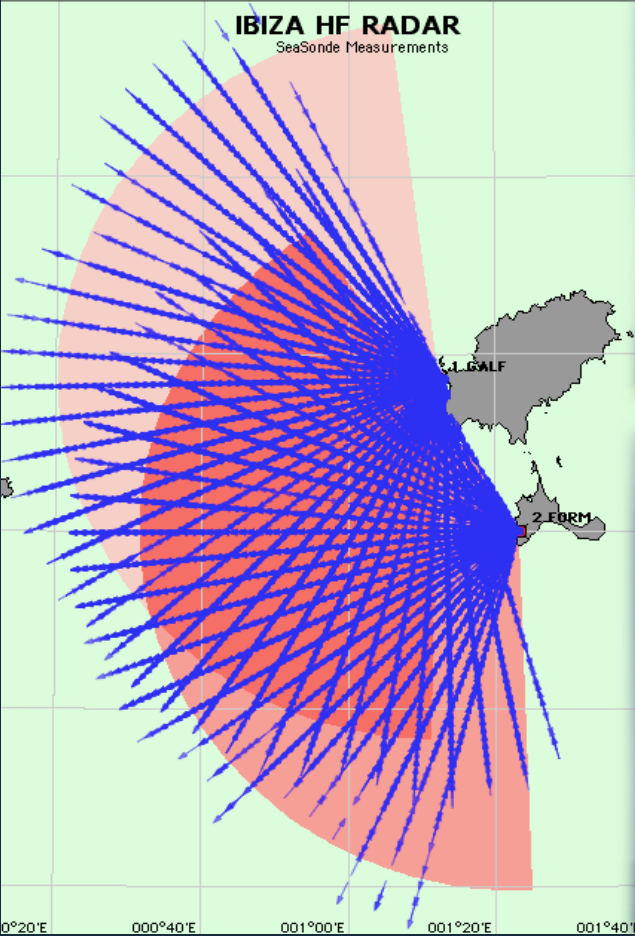

- Fronts and mesoscale eddies
- Circulation choke point

- Interaction between Atlantic and Mediterranean waters:
 - Southward NC: saltier and cooler waters
 - Northward BC: fresher and warmer waters
- Seasonality
 - Winter: larger southward transport
 - Summer: larger northward transport

2 CODAR SeaSonde HF radar stations

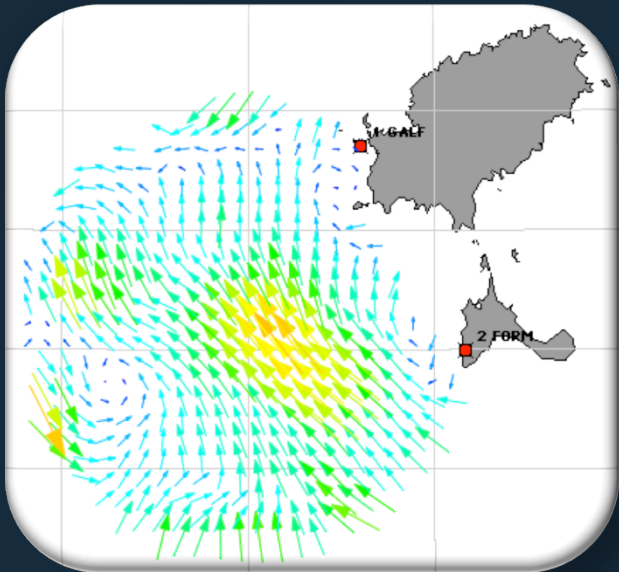

Frequency= 13.5 MHz
Bandwidth= 90 kHz

GALF

FORM

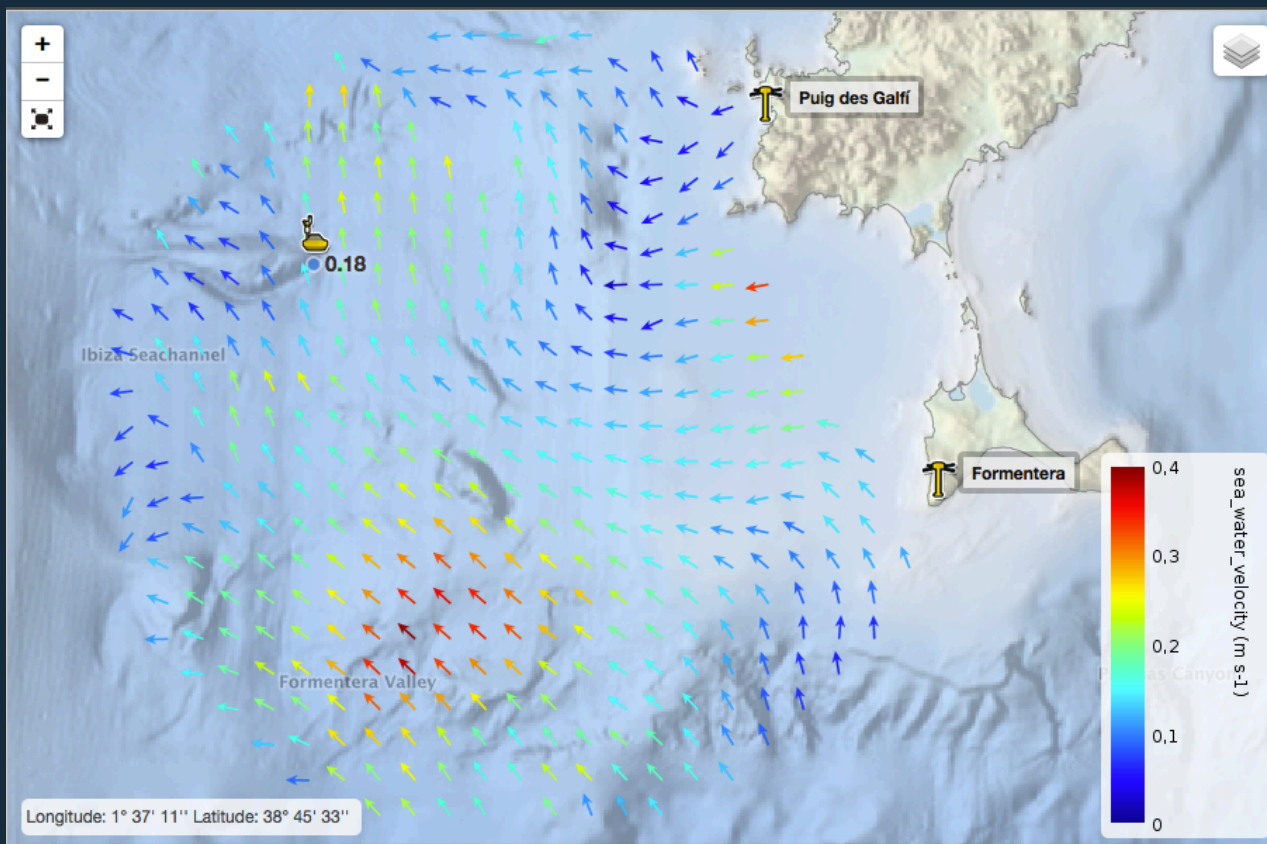

HF radar surface currents

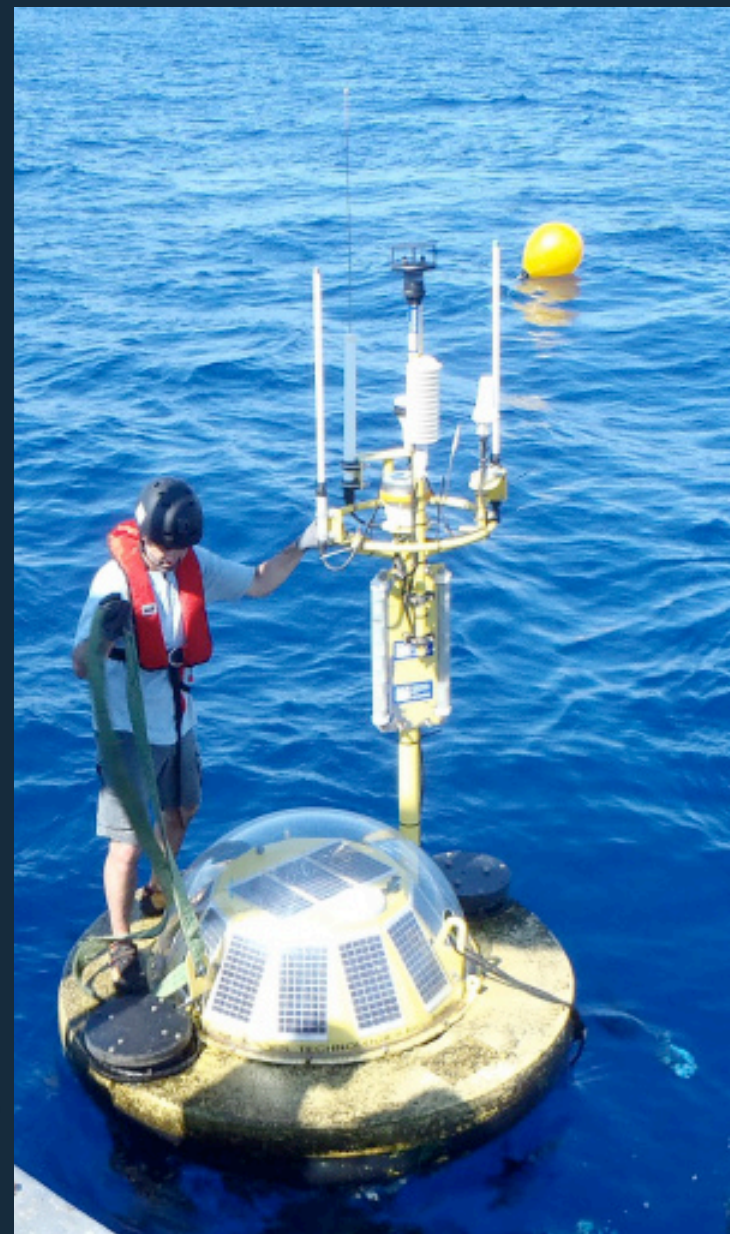

SETTINGS	Output interval	1 h
	Grid resolution	3 km
	Averaging radius	6 km
	Maximum range totals	65 km
	Azimuth range	5°
	Range cell / resolution	1.6 km
	Average Depth	~0.9 m
	Resonant Bragg condition	$\Lambda_{\text{radar}} = 22.2 \text{ m}$ $\Lambda_{\text{wav}} = 11.1 \text{ m}$

03 DATA SET DESCRIPTION: MET-OCEAN BUOY

Ibiza Channel Buoy- CM & ADCP

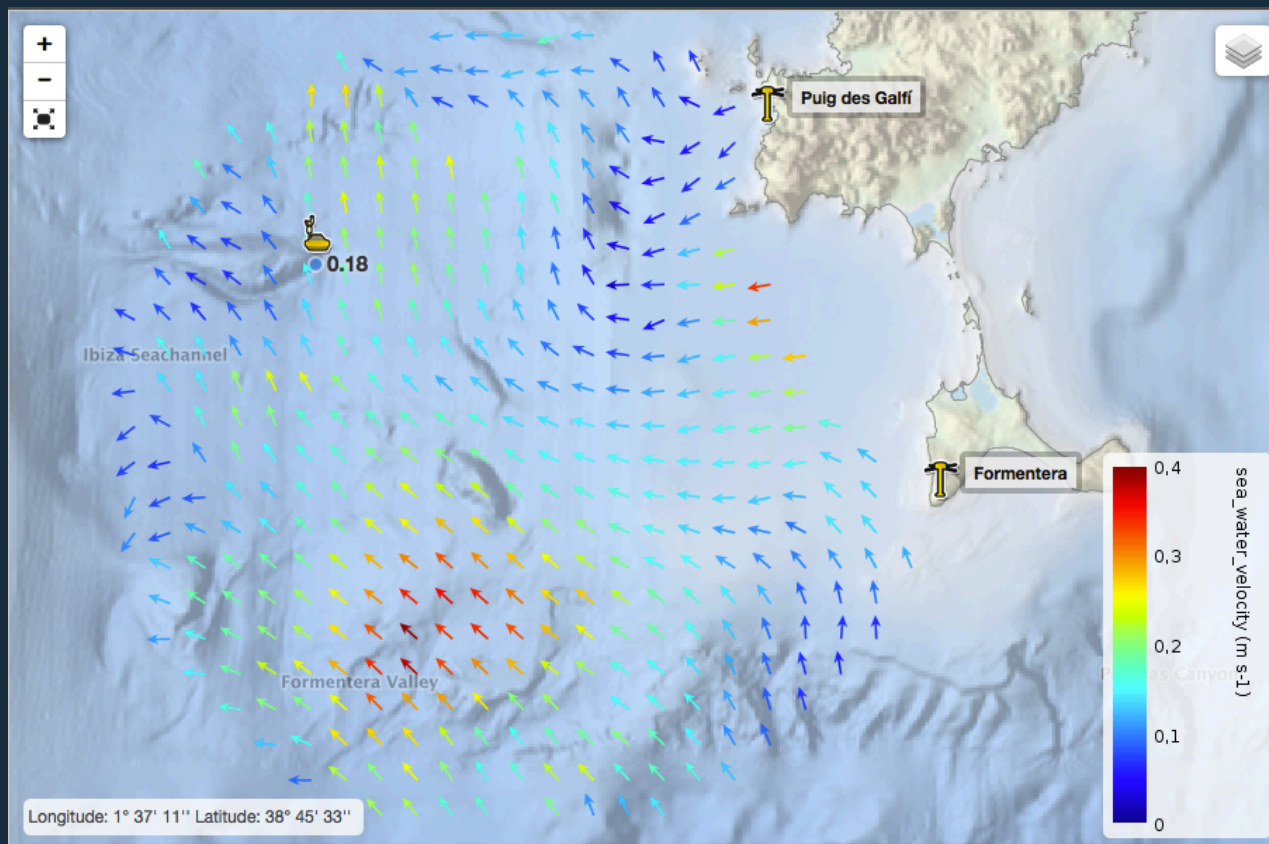

HFR total currents and meteo-buoy location
inside HFR footprint

03 DATA SET DESCRIPTION: MET-OCEAN BUOY

Ibiza Channel Buoy- CM & ADCP

HFR total currents and meteo-buoy location
inside HFR footprint

- Inside HFR total footprint
- NRE data availability
- Comparable depth of measurements with HFR

CM (SCB-DCS002)

CM [depth]= 1.5 m

ADCP (SONTEK002)

ADCP [depth] = 5-125 m

Deployed: 24th Sep.2013

Loc: 38°49.46'N / 0° 47.02 W

Distance: 40 km from GALF

55 km from FORM

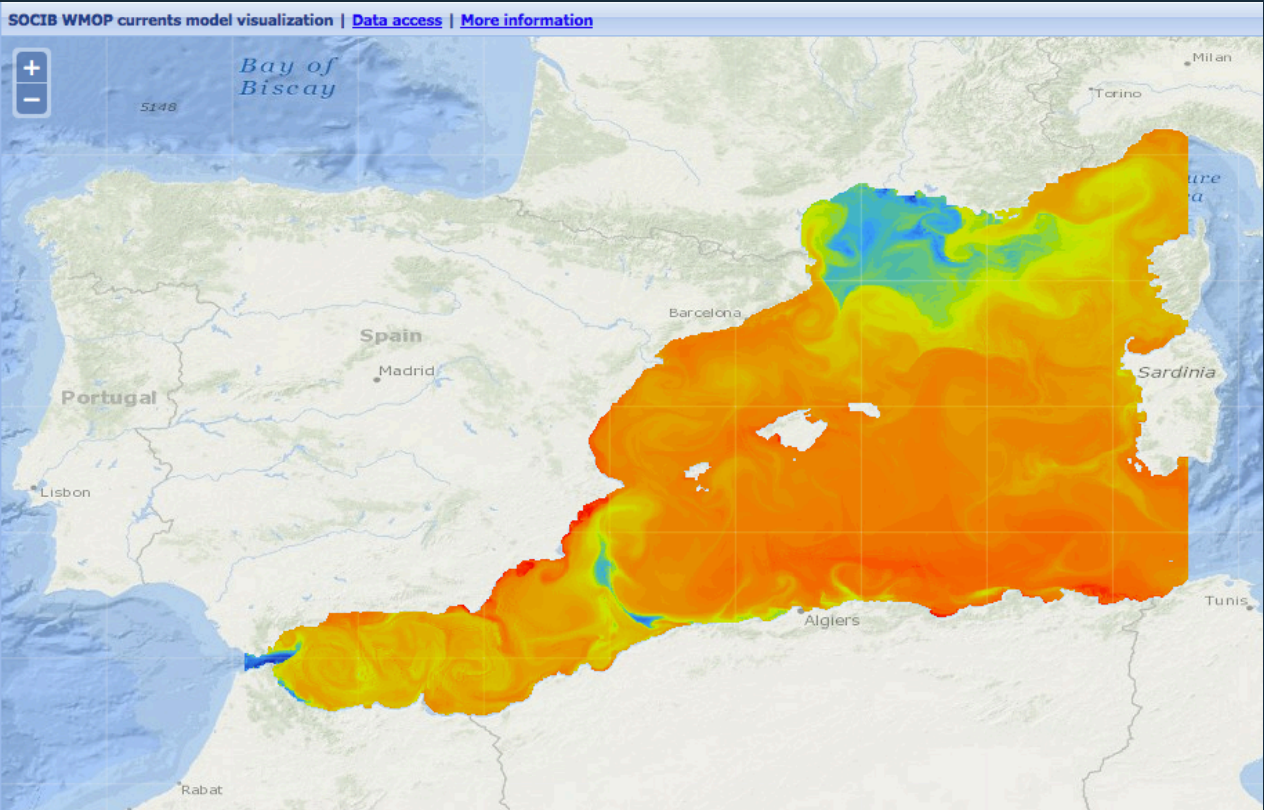

Distance CM-closest radar
grid point = 1400 m

Re-deployed: Jun.2015

Re-deployed: Jun.2017

03 DATA SET DESCRIPTION: WMOP FORECASTING SYSTEM

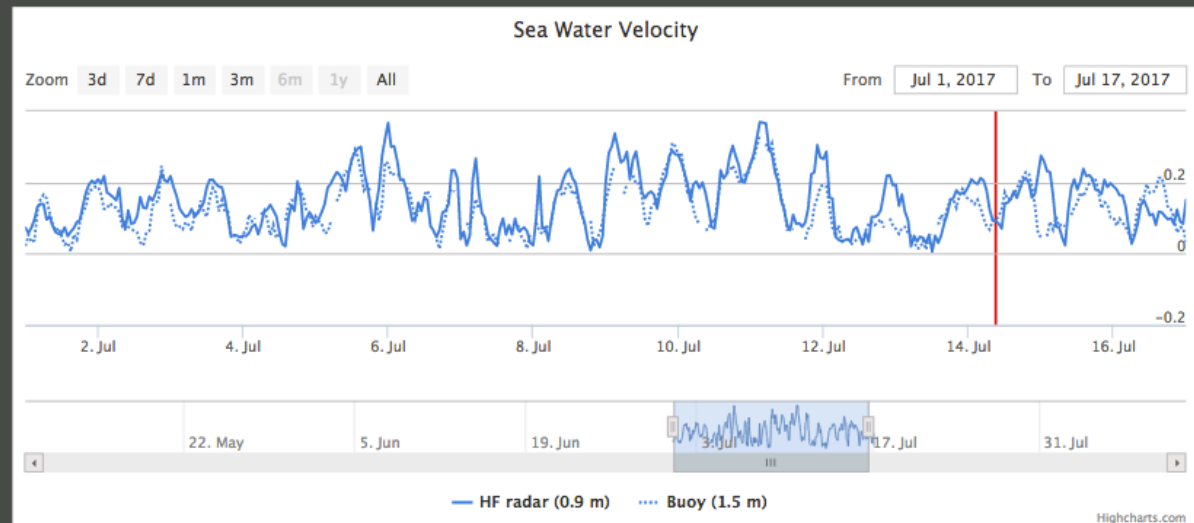

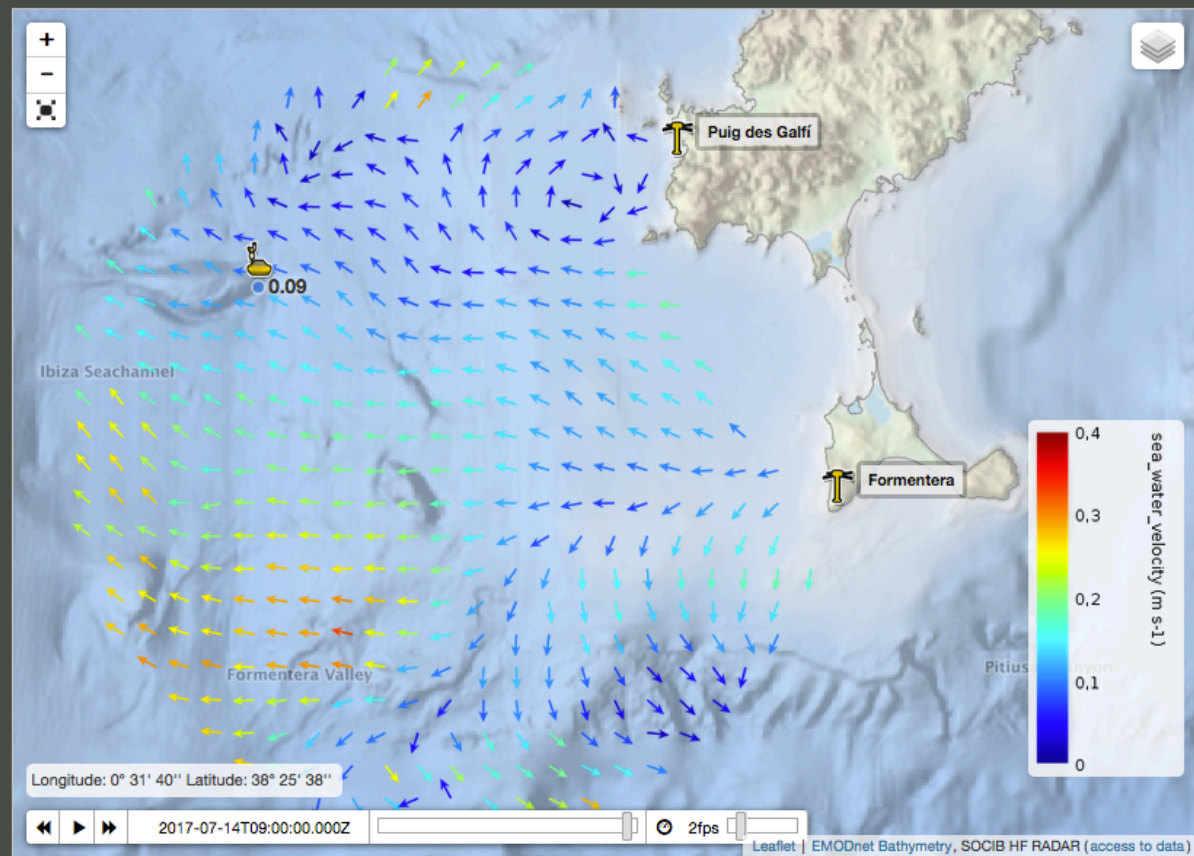

WMOP (Westerm Mediterranean OPerational)

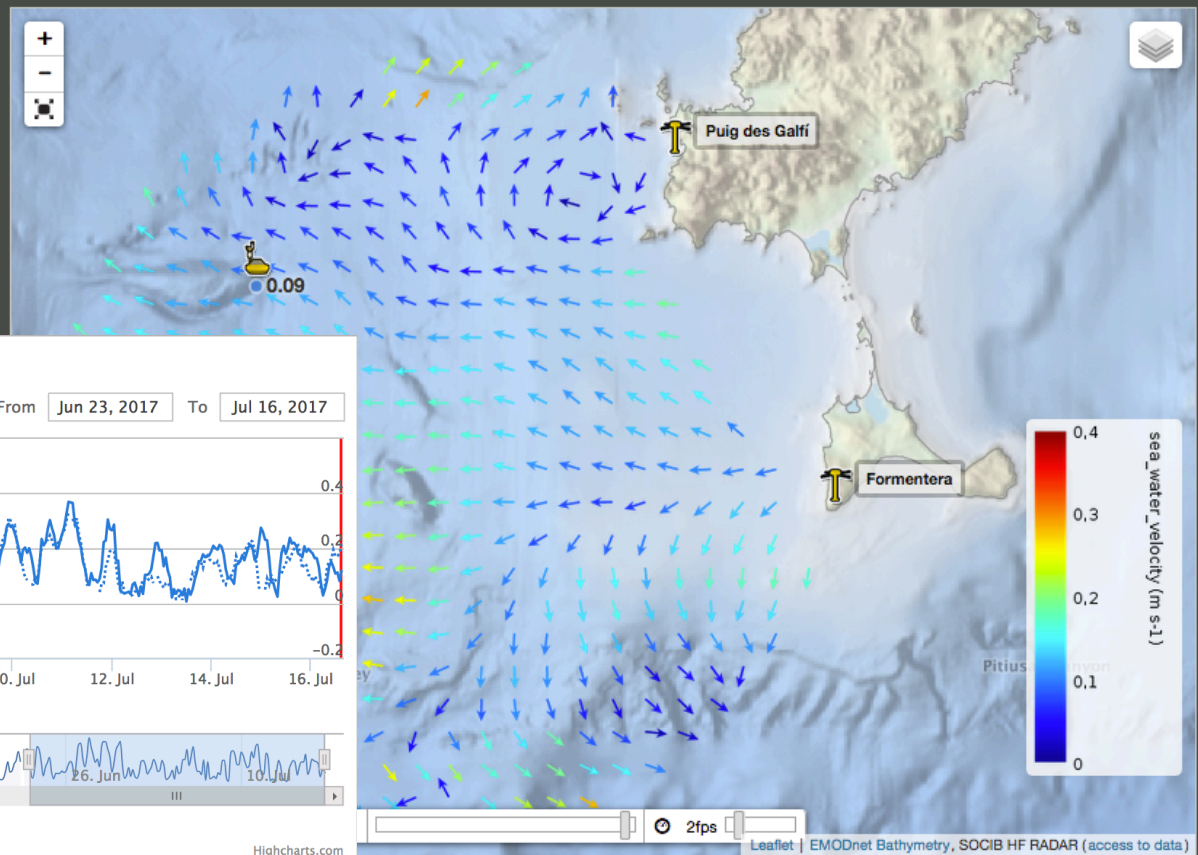

WMOP model spatial domain

MODEL CONFIGURATION	Forecast Length	72 hours
	Spatial Resolution	1/50°~2 km
	Temporal Resolution	3 hours
	Temporal Coverage	27/08/2013-ongoing
	Update frequency	Daily
	Atm Forcing HIRLAM	3h; 1/20°
	Tides	NO
	Rivers	6
	Open boundaries	MED-MFC
	Assimilation	No
	Analysis release freq	Weekly (on Tuesday)
	Variables (3D, 13 levels)	Tem; Sal; U&V

06 CONCLUSIONS

HFR vs. independent in-situ data

- Near real-time validation of HFR data (vs. CM) is a powerful application
 - to detect gaps and malfunction period
 - to provide a quick qualitative assessment to the user
- HFR vs. in-situ data: shows a good agreement
- Both components $CORR > 0.7$ (in accordance with literature)
- Higher RMSE in the meridional component and for HFR vs. ADCP
- HFR slightly overestimates total currents from the CM
- Instrument-to-instrument comparisons present intrinsic limitations
- Performance of in-situ instruments are important

WMOP model validation using HFR currents

- WMOP northward transport too strong
- WMOP model has higher surface velocities
- WMOP model presents a bias on the southern part of the domain
- WMOP model presents higher variability
- Leading to stronger kinetic energy
- Strong flow events are reproduced by WMOP
- One-single statistic is not enough
- Standardized validation methodologies and common comparison schemes
